Abstract : Description of a drier installed at the Kineshenskaya ma-
caroni factory as a part of the continuous production line
of short-section macaroni products. Transfer of produc-
tion from the GMP-1A automatic press is effected by a
pneumatic conveyer, the loading onto the screen belt of
a sloping conveyer and the spreading of the semifinished
product thereon, is done by pneumatic feed to a triangu-
lar cutter-spreader. Drying is conducted at an air-tem-
perature of 45-50° on the upper belt and of 65-70° on

TITLE: Contribution to the theory of mutual approach of aerosol particles in a sound field in the case of Stokes flow conditions

SOURCE: Akusticheskiy zhurnal, v. 12, no. 2, 1966, 266-269

TOPIC TAGS: aerosol, coagulation, hydrodynamics, acoustic effect, acoustic field

ABSTRACT: After pointing out some inaccuracy in earlier investigations on the subject, the authors consider the hydrodynamic interaction between the aerosol particles with allowance for the change of the distance between particles, due to the difference in the amplitudes and phases of vibrational motion of particles. The analysis is restricted to the case when the distance between particles is much larger than the particle radius. A system of equations is developed for the motion of the aerosol particles in the sound field, accurate to second-order quantities with respect to the distance between particles. Approximation solution of the equations shows that pairs of particles of unequal size do come closer together under the influence of the field. The rate of approach of the particles obtained by an approximate method and by computer calculation are in good agreement. The rate of approach decreases with increasing distance between particles and with decreasing difference between their sizes,

being of the order of 10^{-3} - 10^{-4} cm/sec at 500 cps and of the order of 1 - 10^{-1} cm/sec at 10,000 cps. At large distances between particles, the velocity of the Stokes approach is therefore small and cannot exert noticeable influence on the coagulation of the aerosol particles. At small distances, however, the particles have a sufficiently large approach velocity, amounting to 1 - 10^{-1} cm/sec. Orig. art. has: 3 figures and 8 formulas.

TITLE: A method for obtaining chloroprene Class 12, No. 768685

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 5, 1965, 21

TOPIC TAGS: chloroprene, vinyl acetate, hydrogen chloride, copper chloride, amine, formamide, dimethylformamide

ABSTRACT: This Author Certificate presents a method for obtaining chloroprene by the interaction of vinyl acetylene and hydrogen chloride. The reaction is carried out at a high temperature in the presence of a catalyst of hydrogen chloride and copper chloride in a solution. To increase the yield of the final product, the catalyst is used in a solution of amine or related oxygen-bearing amines, such as formamide, dimethylformamide, or methylpyrrolidone.

"Risks of Tonsillectomy and Adenotomy in Cases of Allergy of the Respiratory Organs in Children."

Budapest, Orvosi Hetilap, Vol 104, No 30, 28 July 63, pages 1409-1412.

Abstract: [Authors' Hungarian summary modified] The effect of the surgical procedures was investigated in 92 children between 3-14 years suffering from respiratory allergy. The observations suggest that tonsillectomy and adenotomy are contraindicated in cases of respiratory allergy. In 84.7 per cent of the cases surgery proved to be without benefit. The first asthmatic attack was precipitated by the surgery in 10 cases, the allergy worsened in 29 cases, no effect was seen in 39 cases. Improvement was noted in 9 cases and only 5 cases were cured completely. The indications which might make surgery necessary, in the authors' opinion, are discussed. The precautions which are helpful in the decrease of the undesirable after-effects of the surgery are also presented. 14 Eastern European, the rest Western references.
